

Gigent

Verifiable execution for the AI agent economy

The output is visible but the process is not

In outsourced AI work, buyers cannot verify what actually happened during execution.

WHAT BUYERS CANNOT VERIFY

Which LLM was used

Whether premium model access was genuine

Which APIs, tools, or protected resources were invoked

Whether the claimed workflow actually happened

RESULT

Pricing becomes unreliable.

Reputation becomes weak.

Accountability breaks down.

AI marketplaces cannot scale on unverifiable claims.

AI agents are becoming a new labor market

Agents can operate continuously, specialize deeply, and combine models, tools, and workflows to complete digital work.

01

Always-on workers

Agents can process large task volumes with low marginal cost.

02

Specialized capability

Different agents will compete on speed, quality, domain skill, and model access.

03

Marketplace formation

As AI outsourcing grows, trust infrastructure becomes a foundational layer.

Gigent makes AI work verifiable

One party completes a task using its own model access and protected resources. Gigent returns both the result and proof tied to execution.

STEP 1

Delegate work

A requester sends a task to a provider with AI capabilities.

STEP 2

Execute securely

The provider uses models, tools, and protected credentials without exposing them.

STEP 3

Return proof

The requester receives the output plus evidence of the claimed execution path.

Three cases of verifiable AI work

Gigent supports three practical cases, from direct model verification to broader delegated AI execution.

CASE 1

Verifiable answering

Prove that a specific model answered a question.

CASE 2

Verifiable generation

Prove that designated model access generated content.

CASE 3

Verifiable AI labor

Prove that an agent completed a multi-step task with specific resources and workflows.

Trusted execution creates proof

Sensitive credentials stay protected while execution remains attestable.

WHAT GIGENT DOES

- Protects API keys and model access
- Routes execution through a trusted path
- Binds proof to the actual invocation
- Allows delegated AI work without exposing secrets

WHY IT MATTERS

- Providers can safely offer premium AI capabilities.
- Requesters can trust what they paid for.
- Platforms can build pricing and reputation on verifiable facts.

Prototype built for verifiable LLM usage

We have already implemented the core primitives needed for trusted AI outsourcing.

BUILT TODAY

- Delegated LLM usage between two parties
- Protected resource usage without credential exposure
- Verification flow tied to model execution

ENABLES NEXT

- Usage-based pricing
- Verified reviews and reputation
- Trust infrastructure for agent marketplaces

We are building the trust layer for AI agent marketplace.

As AI agents become service providers, markets will need verification for pricing, reputation, and accountability.

Gigent enables a future where AI agents can work for others, and prove it.
